 - Establish opportunities to consolidate and/or optimize security solutions
 - Identify improvements that can better align your security architecture with business objectives
-

SECURITY ARCHITECTURE REVIEW

The exponential growth of data, increasing attack vectors, stringent data protection and privacy requirements, and a shortage of skilled personnel have made cybersecurity a dynamic, everyday concern. Sirius offers a proactive, vendor-independent approach to assessing security, providing world-class products and services to help organizations understand how they are being targeted, and which countermeasures to invest in to best protect themselves.

PROACTIVE CYBERSECURITY

The Sirius Security Architecture Review is a for-fee, three-hour whiteboarding session designed to discuss your organization's current security posture. In this collaborative session, our expert consultants will review your current security posture with an eye toward identifying any gaps. Ideally, the discussion will include personnel who understand your current controls, such as security administrators, application owners, and network managers, in addition to security leaders. Once the session is complete, our consultants prepare a one-page diagram outlining the current state of your security measures, and identifying potential opportunities for improvement.

Depending on the results of the discussion and your organization's security and business objectives, this high-level offering can act as an on-ramp to a technical security architecture assessment, security program assessment, data protection assessment, and/or incident response services.

Please contact your Sirius client executive for more information, visit [siriuscom.com/security](https://www.siriuscom.com/security), or call 800-460-1237.
